

# ACTIVE DIRECTORY (AD)

The primary function of an **Active Directory** is to provide **authentication** and **authorisation** to users on the network. This means, users can sign into **multiple applications** using a **single** form of **authentication**.

## Setting up AD in MSite

When logged into MSite, navigate to:

- System
- Integrations
- Azure AD
- Add Azure AD

Next enter the AD information:

- Title
- Domains
- Endpoint Address
- Select Save

### Add Azure AD Integration

Title \*

Example

Domains \*

*Use commas to separate values*

example.com|

Endpoint Address \*

https://login.microsoftonline.com/1b6f9290-35c6-4dba-9c82-b40a13bf0e32/federatic

Cancel

Save

The **AD** will now be added to MSite and **single sign on** will be implemented for project users when signing into MSite.
